

GRAIN AERATION

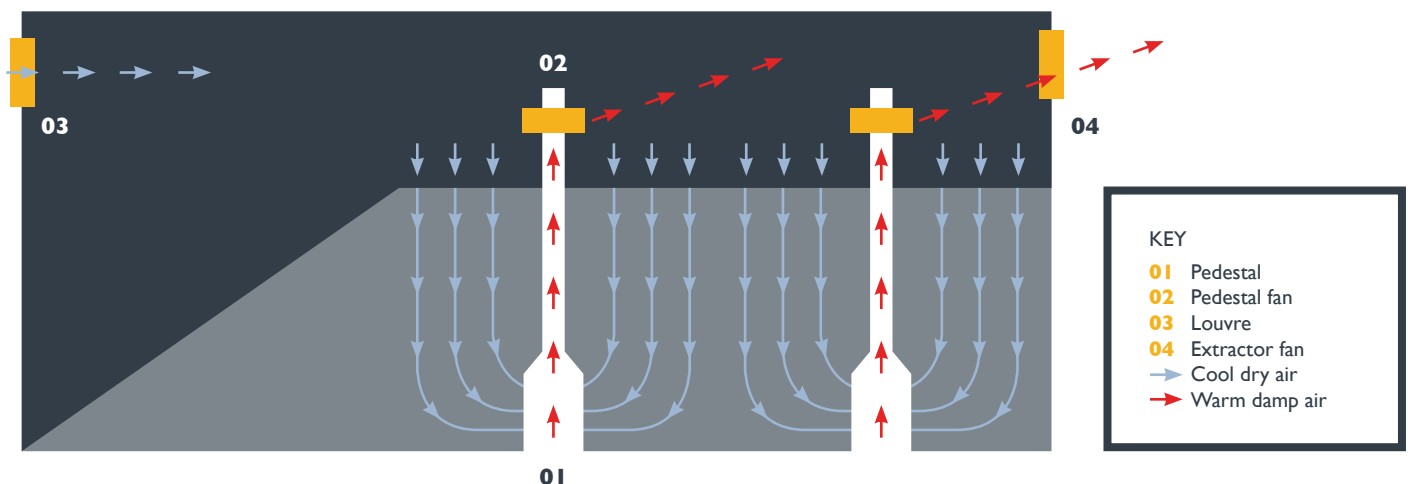

Grain Aeration

Fans and pedestals will cool and condition grain in store and form part of a professional crop storage system.

GRAIN AERATION

EXAMPLE GRAIN STORE LAYOUT

Pedestals

Pedestals are free-standing, metal, vertical ventilation ducts. Unique design centrifugal fans fit into the top and can be moved easily between them.

Easy Handling

Pedestals are vertical and visible in the store. Typically they are spaced at least 6m apart so loading and unloading grain around them is achieved easily.

Fast Cooling

Pedestals are the fastest low volume cooling system, operating at 20% above the required rate. Crops cool quickly and evenly to conserve quality, without the need for insecticides. Pedestals will cool grain straight off the combine, hot off the drier to increase capacity and chill the grain to avoid insects and harmful moulds.

Versatile

Pedestals will cool, dry and condition, long or short term in bulk stores, bins and silos. They have been used with all bulk stored crops - cereals, rape, rice, beans, peas, potatoes, wood chips and many more.

Proven Success

Stored grain represents a huge investment. Maximising the return from this investment requires a professional system that maintains crop quality. Martin Lishman systems draw on 40 years of successful experience to provide the most energy-efficient, cost-effective, practical and convenient way to do the job.
